

# Mining Tycoon Basic Gambler Setup

The Gambler setup relays on the fact that cheap ores are more valuable when crushed and nanosifted. 1 dust produces nanosifted ores with an average value of \$114 per dust.\*

**Notes:**

- \*Citation needed, but this seems to be correct through experimentation.
- Low value bars include Aluminium if no duplicator, and Uranium if using a duplicator. Mining anything below silver has the same value in this setup.
- Dust from the Nano Sifters are ideally turned into Clay Blocks, then Ceramic Casings, then polished.
- Bars should be ideally be tempered, alloyed, and turned into other items such as tablets.
- The dust can be combined if only 1 Nano Sifter is availabe, but be aware that no Stone will be produced by the Blast Furnace if the output is blocked, so ensure there are plenty of conveyers to store excess Stone/Dust.
- Alterations can be made to filter higher value ores to an Ore Smelter instead of the Blast Furnace, which gives more bar value but less ore produced. Stone can also be prospected for higher value gems, and other rebirth machines can be included. For a more thorough setup see the rebirth guide.
